**Abstract:** In this paper, we study fuzzy separation axiom  $T_i$ , i = 0,1,2,3 in the fuzzy topological ring space. Also the relationship between the types of fuzzy separation axiom was studied.

**Keywords**: Fuzzy topological ring; fuzzy  $T_i$  space, i = 0,1,2,3

#### 1. Introduction:

In 1965 [11], Zadeh L. A. gave the definition of fuzziness. After three years C. Chang [2] gave the notion of fuzzy topology. In 1990[1], Ahsanullah and Ganguli, depended on the convergent in fuzzy topological space in the sense of Lowen[7, 8] to introduce the concept of fuzzy nbhd rings which gives the necessary and sufficient condition for a prefilter basis to be fuzzy nbhd prefilter of 0 in fuzzy topological ring. Also they are study the notions of right and left bounded fuzzy set and precompact fuzzy set fuzzy nbhd rings.

In 2009, Deb Ray, A. and Chettri, P [3] introduced fuzzy topology on a ring. Also in [4] they introduced fuzzy continuous function and

studied left fuzzy topological ring. Our working to study fuzzy separation axiom  $T_i$ , i = 0,1,2,3 in the fuzzy topological ring space and obtaining the relationship between  $T_i$ , i = 0,1,2,3 spaces in the fuzzy topological ring space

For rich the paper, some basic concept of fuzzy set, fuzzy topology and fuzzy topological ring are given below. The symbol I will denote to the closed interval [0,1].

## **1.1 Definition** [11]

A fuzzy set in R is a map  $\partial: R \to I$  and, that is, belonging to  $I^R$  (the set of all fuzzy set of R). Let  $E \in I^R$ , for every  $r \in R$ , we expressed by E(r) of the degree of membership of r in R. If E(r) be an element of  $\{0, 1\}$ , then E is said a crisp set.

## 1.2 Definition [2]

A class  $\mu \in I^R$  of fuzzy set is called a fuzzy topology for R if the following are satisfied

- 1)  $\emptyset, R \in \mu$
- 2)  $\forall E, H \in \mu \rightarrow E \land H \in \mu$
- 3)  $\forall (E_j)_{j \in J} \in \mu \rightarrow \bigvee_{j \in J} E_j \in \mu$

 $(R, \mu)$  is called fuzzy topological space. if  $A \in \mu$ Then A is fuzzy open and  $A^c$  (complement of A) is a fuzzy closed set.

## **1.3 Definition [1, 3]**

A pair  $(R, \mu)$ , where R a ring and  $\mu$  be a fuzzy topology on R, is called fuzzy topological ring if the following maps are fuzzy continuous:

- 1)  $R \times R \rightarrow R$ ,  $(r,k) \rightarrow r + k$ .
- 2)  $R \rightarrow R$ ,  $r \rightarrow -r$
- 3)  $R \times R \rightarrow R (r,k) \rightarrow r.k$

## 1.4 Definition [4]

A family B of fuzzy nbhds of  $r_{\alpha}$ , for  $0 < \alpha \le 1$ , is called a fund. system of fuzzy nbhds of  $r_{\alpha}$  iff for any fuzzy nbhd V of  $r_{\alpha}$ , there is  $U \in B$  such that  $r_{\alpha} \le U \le V$ 

## 1.5 Definition [4]

Let *R* be a ring and  $\mu$  a fuzzy topological on *R*. Let *U* and *V* are fuzzy sets in *R*. We define U + V, -V and  $U \cdot V$  as follows

$$\begin{split} &(U+V)(k) = \sup_{k=k_1+k_2} \min\{U(k_1), V(k_2)\} \\ &-V(k) = V(-k) \\ &(U.V)(k) = \sup_{k=k_1+k_2} \min\{U(k_1), V(k_2)\} \end{split}$$

## 1.6.Theorem [4]

If *R* is a fuzzy topological ring then there is a fundamental system of fuzzy nbhds *B* of 0  $(0 < \alpha \le 1)$ , such that the conditions:

- (i)  $\forall U \in B$ , then  $-U \in B$
- (ii)  $\forall U \in B$ , then *U* is symmetric
- (iii)  $\forall U, V \in B$ , then  $U \land V \in B$
- (iv)  $\forall U \in B$ , there is  $V \in B$  such that  $V + V \le U$
- (v)  $\forall U \in B$ , there is  $V \in B$  such that  $V \cdot V \leq U$ (vi)  $\forall r \in R, \forall U \in B$ , there is  $V \in B$  such that a  $r \cdot V \leq U$  and  $V \cdot r \leq U$ .

#### **1.7 Definition** [7]

 $(R, \mu)$  is fully stratified fuzzy topology on R if the fuzzy topology  $\mu$  on R contain all constant fuzzy set

## **1.8 Definition** [10]

A fuzzy topological space  $(R, \mu)$  is said to be fuzzy  $T_0$ -topological space iff  $\forall r_\alpha, k_\alpha \in$  $R, r \neq k, \exists U \in \mu$  such that either U(r) = 1and U(k) = 0 or U(k) = 1 and U(r) = 0.

#### **1.10 Definition** [10]

A fuzzy topological space  $(R, \mu)$  is said to be fuzzy  $T_1$ - topological space iff  $\forall r_{\alpha}, k_{\alpha} \in R, r \neq k, \exists U, V \in \mu$  such that

$$U(r) = 1$$
,  $U(k) = 0$  and  $V(r) = 0$ ,  $V(k) = 1$ 

## **1.11 Definition [10]**

A fuzzy topological space  $(R, \mu)$  is said to be fuzzy Hausdorff or fuzzy  $T_2$  space iff for any two distinct fuzzy points  $r_{\alpha}, k_{\alpha} \in R$ , there exists disjoint fuzzy sets  $U, V \in \mu$  with

$$U(r) = V(k) = 1.$$

## **1.12 Definition [10]**

A fuzzy topological space  $(R,\mu)$  will be called fuzzy regular if for each fuzzy point  $r_{\alpha}$  and each fuzzy closed set H such that H(r)=0 there are fuzzy open sets U and V such that U(r)>0,  $H\leq V$  and  $U\wedge V=\emptyset$ .

## **1.14 Proposition [10]**

If a space R is a fuzzy regular space, then for any open set U and a fuzzy point  $r_{\alpha} \in R$  such that cl(U)(r) = 0 there exists an open set V such that  $\alpha \leq V \leq cl(V) \leq U$ 

#### **1.15 Definition [10]**

A fuzzy topological space  $(R, \mu)$  will be called normal if for each pair of fuzzy closed sets  $H_1$  and  $H_2$  such that  $H_1 \land H_2 = \emptyset$  there exist fuzzy open sets  $U_1$  and  $U_2$ 

such that  $U_1 \le H_1$  and  $U_2 \le H_2$  and  $U_1 \land U_2 = \emptyset$ .

## **1.16 Definition [10]**

A fuzzy topological space  $(R, \mu)$  is said to be fuzzy  $T_3$ -topological space iff it is fuzzy  $T_1$  -and fuzzy regular.

## 2. Separation Axiom

## 2.1 Theorem

Let  $(R, \mu)$  be a fuzzy topological ring. If  $k_{\alpha} \in \{r_{\alpha} : R(r) = \max\{R(h)\}, \forall h \in R\}$  and U is a fuzzy nbhd of 0, then k + U is a fuzzy nbhd of k such that  $(k + U)(k) = \max\{R(h)\}$ ,  $\forall h_{\alpha} \in R\}$ .

#### **Proof**

Since U is a fuzzy nbhd of 0, there exists V fuzzy open set such that  $V \subseteq U$  and  $V(0) = U(0) = \max\{R(h)\}, \ \forall h \in R\}$ . Let  $g_k(r_\alpha): (R, \mu) \to (R, \mu), \ g_k(r) = r_\alpha + k_\alpha. \ g_k$  is a fuzzy homeo. Thus k + V is a fuzzy open set.

$$k + V(k) = V(k - k) = V(0)$$

$$= \max\{R(h)\}, \quad \forall h \in R.$$

$$k + U(r) = U(r - k) \ge V(r - k) = k + V(r) \text{ for all } r \in R.$$

Thus there exists k + V fuzzy open such that  $k + V \le k + U$  and  $(k + V)(K) = (k + U)(k) = \max\{R(h)\}, \ \forall h \in R$ 

## 2.2 Theorem

Let  $(R, \mu)$  be a fuzzy topological ring. If  $k_{\alpha} \in \{r_{\alpha} : R(r) = \max\{R(h)\}, \ \forall h \in R\}$  and

U is a fuzzy nbhd of  $k_{\alpha}$  such that  $U(k) = \max\{R(h)\}$ ,  $\forall h \in R$ , then U - k is a fuzzy nbhd of 0 such that  $(U)(0) = \max\{R(h)\}$ ,  $\forall h \in R$ .

## **Proof**

Since U is a fuzzy nbhd of  $k_{\alpha}$ , there exists V fuzzy open set such that  $V \subseteq U$  and  $V(k) = U(k) = \max\{R(h)\}, \ \forall h \in R$ . Let  $g_k \colon R \to R$ ,  $g_k(r_{\alpha}) = r_{\alpha} - k_{\alpha}$ ,  $g_k$  is a fuzzy homeo. Thus -k + V is a fuzzy open set.  $V - k(0) = V(0 + k) = V(k) = \max\{R(h)\}, \ \forall h \in R\} = V(0).$   $U - k(r) = U(r + k) \geq V(r + k) = V - k(r)$  for all  $r \in R$ .

Thus there exists V - k fuzzy open set such that  $V - k \le U - k$  and  $V(0) = U - k(0) = \max\{R(h)\}, \ \forall h \in R\}.$ 

## 2.3 Definition

A fuzzy topological ring  $(R, \mu)$  is said to be Fuzzy  $T_0$  – space iff for each  $r_\alpha$ ,  $k_\alpha$  s.t  $r \neq k$  there exists fuzzy open set U s.t  $r_\alpha \in U$ ,  $k_\alpha \notin U$  or  $k_\alpha \in U$ ,  $r_\alpha \notin U$ 

## 2.4 Example

Let  $Z_2$  be the ring of integers modulo 2. Define fuzzy sets  $E_1$ ,  $E_2$ ,  $E_3$  on  $Z_2$  as  $E_1([0]) = 0.9$ ,  $E_1([1]) = 0$ ,  $E_2([0]) = 0$ ,  $E_2([1]) = 0.9$  for all  $r \in Z_2$ . Let  $\mu = \{\emptyset, Z_2, E_1, E_2\}$  is a fuzzy topological ring on  $Z_2$ , then  $(Z_2, \mu)$  is a fuzzy  $T_0$  – topological ring space.

#### 2.5 Definition

A fuzzy topological ring  $(R, \mu)$  is said to be Fuzzy  $T_1$  – space iff for each  $r_{\alpha}$ ,  $k_{\alpha}$  s.t  $r \neq k$  there exists fuzzy open sets U, V s.t  $r_{\alpha} \in U$ ,  $k_{\alpha} \notin U$  and  $k_{\alpha} \in V$ ,  $r_{\alpha} \notin V$ 

## 2.6 Example

Let  $Z_2$  be the ring of integers

modulo 2. Define fuzzy sets  $E_1$  ,  $E_2$  ,  $E_3$  on  $\mathbb{Z}_2$  as

$$E_1([0]) = 0.25, E_1([1]) = 0,$$

$$E_2([0]) = 0$$
,  $E_2([1]) = 0.25$   
 $E_3([0]) = 0.25$ ,  $E_3([1]) = 0.25$ 

for all  $r \in \mathbb{Z}_2$ . Let  $\mu = \{\emptyset, \mathbb{Z}_2, E_1, E_2, E_3\}$  is a fuzzy topological ring on  $\mathbb{Z}_2$ , then  $(\mathbb{Z}_2, \mu)$  is a

fuzzy  $T_1$  – topological ring space.

#### 2.7 Definition

A fuzzy topological ring  $(R, \mu)$  is said to be Fuzzy  $T_2$  – topological ring space iff for any two fuzzy points  $r_{\alpha}$ ,  $k_{\beta}$  s.t  $r \notin \text{supp}(k)$  and  $k \notin \text{supp}(r)$ , there exists two fuzzy open sets U, V s.t  $r_{\alpha} \in U$ ,  $k_{\alpha} \in V$  and  $U \land V = \emptyset$ 

## 2.8 Example

Let  $Z_4$  be the ring of integers modulo 4, with fuzzy discrete topology  $\mu_D$  on it. The fuzzy topological ring  $(Z_4, \mu_D)$  is Fuzzy  $T_2$  – topological ring space.

#### 2.9 Definition

A fuzzy topological ring  $(R, \mu)$  is said to be Fuzzy regular space if  $\forall r_{\alpha} \in R$  and a fuzzy closed set F with F(r) = 0 there exists 

#### 2.10 Definition

A fuzzy topological ring  $(R, \mu)$  is said to be Fuzzy  $T_3$  —topological ring space if  $(R, \mu)$  is fuzzy  $T_1$  —space and fuzzy regular topological ring space.

## **2.11 Example**

Let  $\mathbb{R}$  be the ring of real number, with fuzzy usual topology  $\mu_U$  on it. Then  $(\mathbb{R}, \mu_U)$  is Fuzzy  $T_3$  – topological ring space

## 2.12 Theorem

If  $(R, \mu)$  is fuzzy  $T_2$ - topological ring space then  $\{0_{\alpha}\}$  is fuzzy closed subset in  $(R, \mu)$ .

#### **Proof**

Let  $(R, \mu)$  is fuzzy  $T_2$ - topological ring space. For any  $r_{\alpha} \neq 0_{\alpha}$  be another fuzzy point, assume U(r) > 0,  $\forall U \in \{B_0\}$ , then there exists fuzzy open set V of  $r_{\alpha}$  s.t V(0) = 0, implies  $\overline{\{0\}}(r) = 0$ . Since r is arbitrary. Thus  $\overline{\{0_{\alpha}\}} = \{0_{\alpha}\}$  and  $\{0_{\alpha}\}$  is fuzzy closed set.

#### 2.13 Theorem

For any fuzzy topological ring space  $(R, \mu)$ , if  $\{0_{\alpha}\}$  is fuzzy closed subset in R and if  $B_0$  is a basis of fuzzy nbhd of  $0_{\alpha}$ , then  $\Lambda_{V \in \{B_0\}} V = \{0_{\alpha}\}$ .

#### proof

Let  $\overline{\{0_\alpha\}}$  be an fuzzy closed set and  $\{B_0\}$  be a basis of fuzzy nbhds of  $0_\alpha$ . Then by theorem 2.12,  $\{0_\alpha\} = \overline{\{0_\alpha\}} = \Lambda_{V \in \{B_0\}} (\{0_\alpha\} + V) = \Lambda_{V \in \{B_0\}} V$  Thus  $\Lambda_{V \in \{B_0\}} V = \{0_\alpha\}$ 

#### 2.14 Theorem

For any fuzzy topological ring space  $(R, \mu)$ , and  $B_0$  is a basis of fuzzy nbhd of  $0_{\alpha}$ , if  $\Lambda_{V \in \{B_0\}} V = \{0_{\alpha}\}$ , then  $(R, \mu)$  is fuzzy  $T_0$ -topological ring space.

#### **Proof**

Let  $\{B_0\}$  be a basis of fuzzy nbhds of  $0_\alpha$  and  $\Lambda_{V\in\{B_0\}}V=\{0_\alpha\}$ . Let  $r_\alpha$  and  $k_\alpha$  are fuzzy points with different support. Therefor  $r_\alpha-k_\alpha\neq 0$ , so there exists  $V\in\{B_0\}$ , s.t V(r-k)=0. Now by theorem 1.6, k+V(r) is fuzzy nbhd of  $k_\alpha$  and (k+V)(r)=V(r-k)=0. Thus  $r_\alpha\notin k+V$  and  $(R,\mu)$  is fuzzy  $T_0$ -topological ring space.

#### 2.15 Theorem

If  $(R, \mu)$  is fuzzy  $T_0$ - topological ring space, Then  $(R, \mu)$  is fuzzy  $T_1$ -topological ring space

## **Proof**

Let  $(R, \mu)$  be a fuzzy  $T_0$ -topological ring space and let  $r_{\alpha}$  and  $k_{\alpha}$  are fuzzy points with different support. Then there exists fuzzy open set V of  $0_{\alpha}$  s.t (r+V)(k)=0 or (k+V)(r)=0. We can assume that V is symmetric fuzzy open set of  $0_{\alpha}$ . To explain that (r+V)(k)=0 if (k+1)

V)(r)=0 we assume the contrary, suppose that (r+V)(k)>0, therefor (r-V)(k)>0. Implies

$$(r+V)(k) = V(k-r) = V(-(r-k)) = V(r-K) = (k+V)(r) > 0.$$

This contradiction, similarly if (k + V)(r) = 0. Thus  $(R, \mu)$  is fuzzy  $T_1$ -topological ring space.

## 2.16 Theorem

If  $(R, \mu)$  is fuzzy  $T_1$ -topological ring space then  $(R, \mu)$  is fuzzy  $T_3$ -topological ring space.

#### **Proof**

Let  $(R, \mu)$  is fuzzy  $T_1$ -topological ring space and let  $r \in R$ , F be a fuzzy closed subset in R s.t F(r) = 0, then  $F^c(r) = 1$  and  $F^c$  is fuzzy open set. Therefor  $F^c - r$  is an fuzzy open nbhd system of  $0_\alpha$ . Then there exists fuzzy open set  $V_0$  of  $0_\alpha$  s.t  $V_0 \le F^c - r$ . Now

$$\overline{V_0} = \bigcap (V_0 + (F^c - r)) = \bigcap (F^c - r) = \{0_\alpha\},\$$

$$(r+\overline{V_0})(k)=\overline{V_0}(k-r)=\min\{\overline{V_0}(k),\overline{V_0}(-r)\}=$$
 
$$\min\{\overline{V_0}(k),\overline{V_0}(r)\}=\overline{V_0}(k)=V_0(k) \qquad , \forall k\in R$$

implies  $r + \overline{V_0} \le F^c - r$ . Thus  $(R, \mu)$  is fuzzy regular and consequently it is fuzzy  $T_3$ -topological ring space.

#### **2.17.**Theorem

the contrary, suppose For any fuzzy topological ring  $(R, \mu)$ , the therefor (r - V)(k) > 0. following conditions are equivalent

- 1) (R,  $\mu$ ) is fuzzy  $T_2$ -topological ring space
- 2)  $\{0_{\alpha}\}$  is FZ.closed subset in R.
- 3) If  $B_0$  is a basis of nbhd of  $0_{\alpha}$ , then  $\bigcap_{V \in B_0} V = \{0_{\alpha}\}$
- 4) (R,  $\mu$ ) is fuzzy  $T_0$ -topological ring space.
- 5) (R,  $\mu$ ) is fuzzy  $T_1$ -topological ring space.
- 6) (R,  $\mu$ ) is fuzzy  $T_3$ -topological ring space.

#### **Proof**

By theorems 2.10, 2.11, 2.12, 2.13 and 2.14

## 2.18 Theorem

Let  $(R, \mu)$  be a fuzzy topological ring, then Every fuzzy subspace of fuzzy  $T_0$ -space is a fuzzy  $T_0 - space$ .

#### **Proof:**

Obvious

## 2.19 Theorem

Let(R,  $\mu$ ) be a fuzzy topological ring and E is a fuzzy subring of (R,  $\mu$ ), if (E,  $\mu_E$ ) is fuzzy Hausdorff and (R/E,  $\beta$ ) is fuzzy Hausdorff then(R,  $\mu$ )is fuzzy Hausdorff.

#### **Proof**

If R/E is fuzzy Hausdorff, then E is fuzzy closed set in  $(R, \mu)$ .

If also  $(E, \mu_E)$  is fuzzy Hausdorff then  $\{0_\alpha\}$  is fuzzy closed in E.

Hence  $\{0_{\alpha}\}$  is fuzzy closed in  $(R, \mu)$ , and  $(R, \mu)$  is fuzzy Hausdorff.
